# Extremes: pyrocumulonimbus (PyroCb) events

Peterson et al. 2018

Fromm et al. 2022

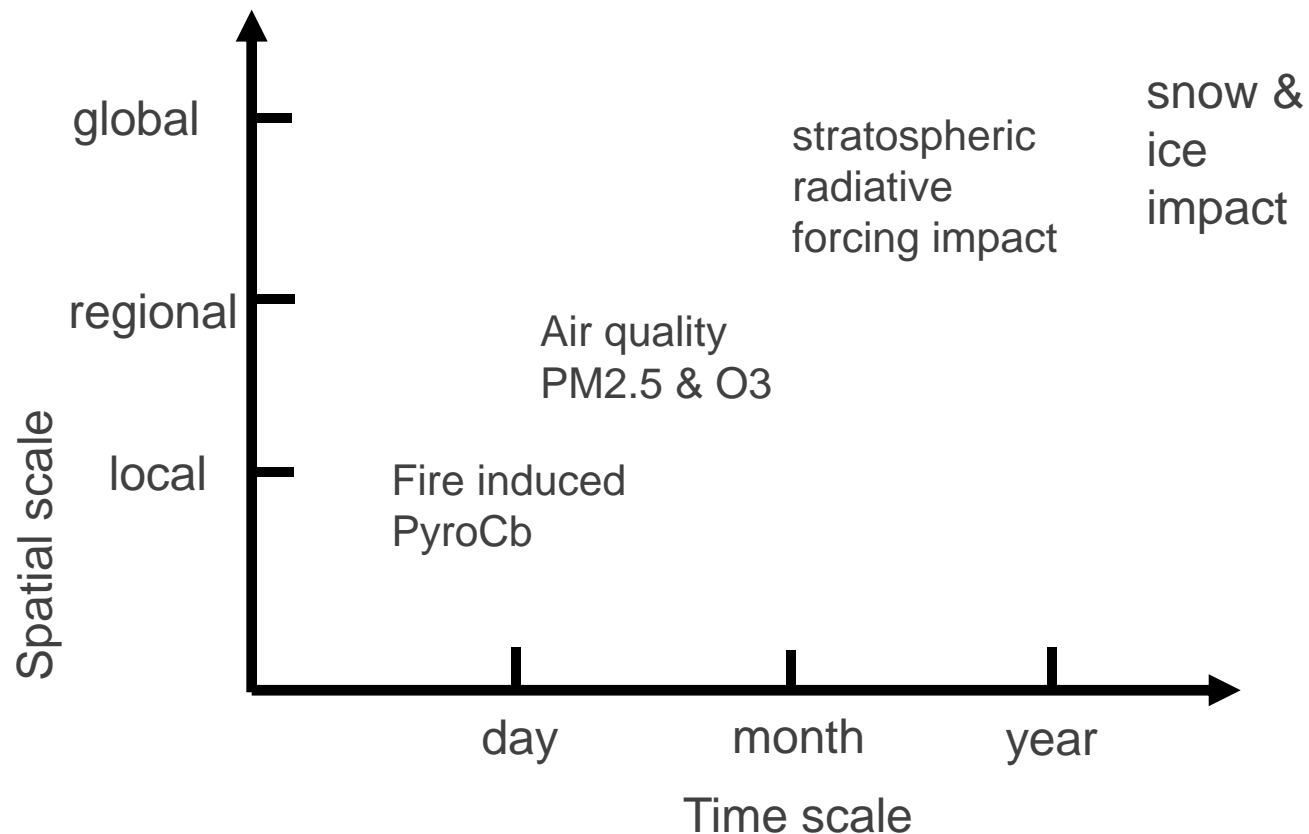

- Injected mass from Pacific Northwest Event is equivalent to a moderate volcanic eruption
- More PyroCb events are observed over Western North America (Peterson 2017).

# The challenges to simulate PyroCb

Peterson et al. 2017

- The PyroCb is triggered by extreme wildfires and hard to be simulated by deep convection scheme.
- Regional Refined Model is better choice

# Multiscale wildfire simulation framework: E3SM California Regionally Refined Model (E3SM-CARRM)

# PyroCb vertical profile

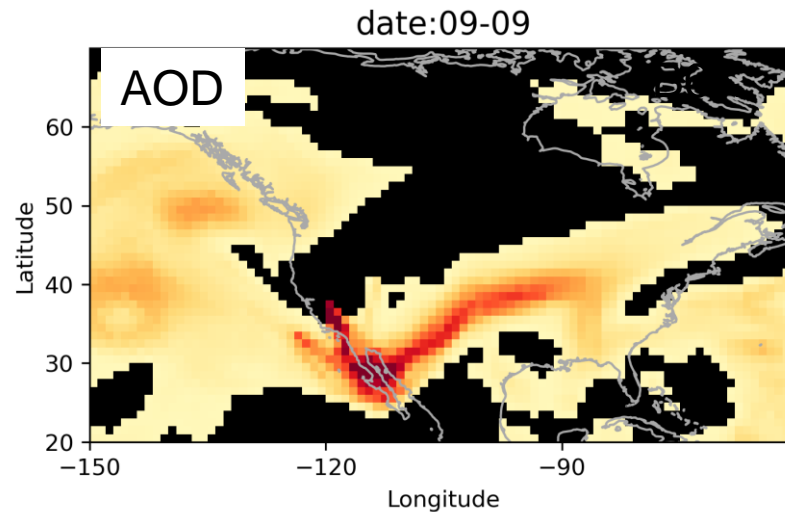

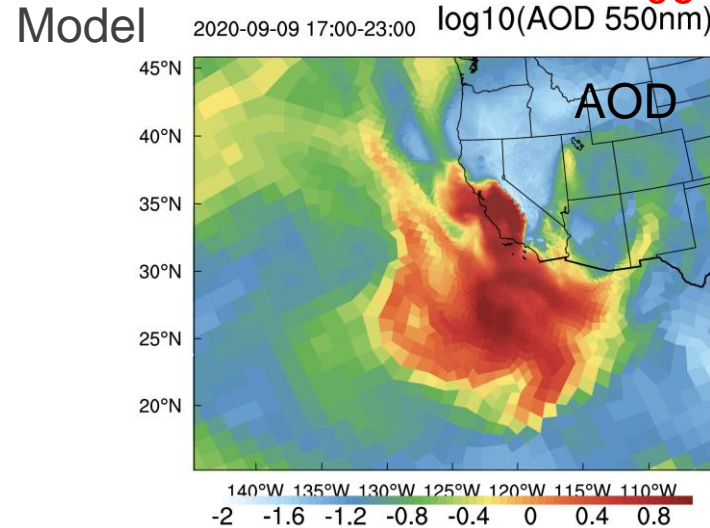

Convection from model dycore

# The regional transport of aerosols

09-09-2020

- E3SM-CARRM captures the regional transport of wildfire aerosols
- Computational efficiency: 0.12 SYPD on LC-dane with 10 cores (8.5 days to simulate one model year)

## Our ongoing work:

- Analyze the dynamics of PyroCb and the role of aerosols.
- Assess the likelihood of PyroCb occurrence in specific incidents.
- Investigate secondary ignitions caused by PyroCb lightning.
- Estimate the impact on local air quality.
- Evaluate aerosol mass injections into the stratosphere from PyroCb events.
- Estimate the effects of wildfires on stratospheric chemistry and radiative forcing.

## Future work

- Prepare long-term, high-resolution wildfire emission data.
- Use pyroCb observations (in-situ, AOD, SAOD, stratospheric balloon data, new satellite instruments) to constrain wildfire implementations.
- Conduct fire season E3SM-RRM simulations to estimate stratospheric injections from pyroCb.
- Apply RRM to regions beyond California if applicable. Utilize E3SM-RRM to generate wildfire aerosol properties for E3SM-LR historical simulations.

- What are the current and unique strengths and foundational capabilities of DOE for this topic?

The CARRM framework has been established and the fire package is in testing phase.

- What are the grand challenges in advancing the research on this topic?

Produce long-term wildfire data. Need various observational data to validate and constrain our model implementations. Computational resources are needed to conduct seasonal scale simulations.

- What role could other agencies play in facilitating our science?

NASA (FireSense, STRIVE) ...
