

Accelerated Climate Modeling
for Energy

Coupled Simulation v1 alpha

- By the end of
📅 01 Nov 2015 **Issue Pull Requests (PRs)** for each feature (feature freeze)
- 📅 01 Nov 2015 -
📅 31 Dec 2015 Create documentation on Phase 2 process of Code Review for features or their aggregate
- 📅 31 Dec 2015 ACME v1.0-alpha - coupled tests and validation from this point on
- 📅 31 Mar 2016 ACME v1.0-beta - configuration and switches decided for all 3 major experiments, only tuning from this point on
- 📅 30 Jun 2016 ACME v1.0 tag
- 📅 01 Jul 2016 Start running all 3 major experiments
- 📅 30 Jun 2017 Complete all 3 experiments

V0.1

Baseline simulations will be complete by December 31

PI control – 100 years

Climate change 1980-2010

Model was not retuned

Simplified, steady-state forcing; system response is time-dependent

Tuning Considerations

- *Baseline metrics serve as basis for measured improvements – also set constraints for tuning*
 - Climatology and trends of zonal precipitation
 - Climatology and trends of zonal top of atmosphere incoming and outgoing radiation
 - Climatology of surface winds
 - Climatology and trends/seasonal cycle of sea ice area fraction (%) and thickness (m)
 - Climatology and trends of SST
 - Trends of ocean heat content
 - Climatology of meridional ocean heat transport, and climatology and trends of MOC mass transport
 - Nino3.4 index

V1 Coupled system Tuning

- Chris Golaz is task leader
- Want a consistent set of tuning parameters for both PI and year 2000
- Priority for people and computers
- Simulated Years per Day
- Triage
 - Committed to new ocean and sea ice
 - Everything else optional – fall back to v0 for other components
