ACME atmosphere Priority Metrics

Thanks to Salil Mahajan and Susannah Burrows as major developers for the effort I will present and use to start discussions today

ACME atmosphere needs quick look diagnostics

- Python based
- Validation of metrics
- Extensible to include tier1B
- Quick and easy to run
- Reproducibility: produces midlevel data that is used to create plots
- Conda based to enable other packages (ncl, UVCDAT)
- Similar to what people do now with AMWG with some key improvements

Metrics	ACCHE Accelerated Climate Modeling	
20160805v0atm.A_WCYCL1	1850_v0atm.ne30_oEC.edison vs. obs (climo)	a.alpha7_00 (Years: 6-10)

coupled diagnostics 20160805v0atm.A WCYCL1850 v0atm.ne30 oEC.edison.alpha7 00-obs/

ACME Coupled Priority Metrics

- Steps to run the package:
 - 1. Choose a machine:
 - 1. Edison
 - 2. Rhea
 - 3. AIMS (Kate still todo)

Note: the script that works on Edison should work on Cori as well. Once this is tested, we can change its name to something more general (e.g., run_NERSC instead of run_EDISON).

- 2. System Set-up:
 - Some (anaconda-2.7-climate environment is used)
- 3. Get the scripts from github
- 4. Edit a single run script:
 - Point to directories, casenames, options to compute climos, etc.
- 5. Run on an interactive node or submit a job
- 6. View the webpage

Grab from ACME github repo

- Sit clone git@github.com:ACME-Climate/PreAndPostProcessingScripts.git
- Scd PreandPostProcessingScripts
- Sit checkout origin/master for the coupled model version
- Sit checkout origin/kevans32_newdiags for atm version
- Solution >cd coupled_diags (showing coupled for now)

run_EDISON.csh or run_RHEA.csh

#!/bin/csh

•

#

Example:

#Driver script to generate coupled diagnostics on rhea #Basic usage:

- set user defined case specific variables below
- 2. execute: csh run_edison.csh

#Meaning of acronyms/words used in variable names below:

	,	
#	test:	Test case
#	ref:	Reference case
#	ts:	Time series; e.g. test_begin_yr_ts, here ts refers to time series
#	climo:	Climatology
#	begin_yr:	Model year to start analysis
#	end_yr:	Model year to end analysis
#	condense:	Create a new file for each variable with time series data for that variable.
#		This is used to create climatology (if not pre-computed) and in generating time series plots
#	archive_dir:	Location of model generated output directory
#	<pre>scratch_dir:</pre>	Location of directory where the user wants to store files generated by the diagnostics.
#		This includes climos, remapped climos, condensed files and data files used for plotting.

set projdir =

/global/project/projectdirs/acme

#USER DEFINED CASE SPECIFIC VARIABLES TO SPECIFY (REQUIRED)

#Test (case variables	
setenv	test_casename	20160520.A_WCYCL2000.ne30_oEC.edison.alpha6_01
setenv	test_native_res	ne30
setenv	test_archive_dir	<pre>/scratch1/scratchdirs/golaz/ACME_simulations</pre>
setenv	<pre>test_short_term_archive</pre>	0
setenv	test_begin_yr_climo	70
	test_end_yr_climo	100
	test_begin_yr_ts	1
setenv	test_end_yr_ts	100

Тор

1,1

run_EDISON.csh or run_RHEA.csh

Similarly for reference case:

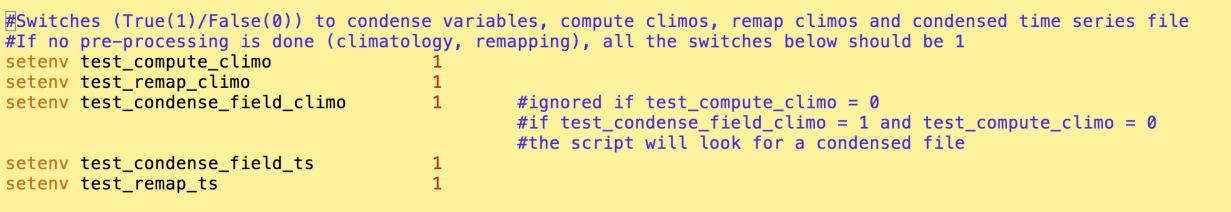

● ● ●	Command=corkscrew snowman.ornl.gov	3128 %h %p salil@e	dison.nersc.gov — ttys	005 — ¥6	
#Reference case variables (similar to	test_case variables)				
<pre>setenv ref_case</pre>	20160520.A_WCYCL1850.ne	30_oEC.ediso	n.alpha6_01		
<pre>setenv ref_archive_dir</pre>	/scratch1/scratchdirs/g	jolaz/ACME_si	nulations		
<pre>#setenv ref_case</pre>	obs				
<pre>#setenv ref_archive_dir</pre>	<pre>\$projdir/obs_for_diagnc</pre>	ostics			
<pre>#The following are ignored if ref_case setenv ref_native_res setenv ref_short_term_archive setenv ref_begin_yr_climo setenv ref_end_yr_climo setenv ref_begin_yr_ts setenv ref_end_yr_ts</pre>	is obs ne30 0 70 100 70 100				

Note #1: Since ACME v1 ocn/ice are so different from v0, comparison with v0 has to be handled separately (v0 data needs to be pre-processed)
Note #2: The script currently handles comparison to ocn/ice v0 time-series only, but changes will be made soon to compare with v1 results as well

Run

Edison:>./run_EDISON.csh

Or

>sbatch run_EDISON.sl Check status: >sqs –u \$USERNAME • Rhea: >./run_RHEA.csh

Or

>qsub run_RHEA.pbs Check status: >qstat –u \$USERNAME

Next steps for discussion

- Avoid use of shell scripts
- Use common packages to read netcdf, HDF etc
 - NCO
 - CDMS2
 - UVCDAT
- Matplotlib to plot, but folks can use other things if they are willing to maintain this on an "opt-in basis" (default is off and not required that software be built)
 - Ncl
 - Matlab
- Create functionality to have templates for different kinds of analysis and plots to scientists can grab an example and modify
- Need validation through a test for all analysis added to the package (see Mike Heroux talk)
- Develop convections for processing and display of data
- Further out: high quality PDF, interactive analysis..
- What else?

http://portal.nersc.gov/project/acme/milena/

coupled diagnostics 20160805v0atm A_WCYCI 1850_v0atm.pe30_oEC.edison.alpha7_00-obs/

Goals for ACME

- Software release with v1
- Full documentation and validation
- Papers can point to diags of runs they used to show validation?

Edit run script: run_Edison.csh or run_Rhea.csh

TEST CASE SPECIFIC VARIABLES

test_casename

test_native_res

test_archive_dir

test_short_term_archive

test_begin_yr_climo

test_end_yr_climo

test_begin_yr_ts

test_end_yr_ts

Name of model run case Atmosphere resolution of the case (e.g. ne30, ne120) Location of case output history files Short term archiving directory structure (Yes/No) Note: short-term archiving does not currently work for MPAS Start year for computing climatology diagnostics End year for computing climatology diagnostics Start year for computing time series diagnostics End year for computing time series diagnostics

Note: last two variables are relevant for atm diags only (ocn/ice scripts load in all output files)

Software Design

Steps

- 1. Extract variables into individual files (nco). Atmosphere only (ocn/ice use python 'xarray' to load in specific fields from many output files).
- 2. Compute climatologies (python scripts, ncclimo)
- 3. Remap files (ncremap)
- 4. Create plots (matplotlib)
- 5. Generate HTML page (csh script to create index.html)

Structure:

- Each script creates separate log files
- Intermediate files are saved
- Final plot data files saved
- Filenames structured.

Software Design

Se Flexible and Extensible

- All case information written to a file for other scripts to access.
- Triable list for analysis is read from a file.
 - Tifferent lists for model vs model and model vs. obs
 - Different lists for climatology and time series analysis
- Variables belong to groups (Radiation FLNT, FSNT etc.)
- List also contains information about interpolation grid
- Easy to add new variables
- Derived variables allowed
 - Required to add the formula to a python script as well (e.g. PRECT = PRECC + PRECL)
- Will soon mirror MPAS Analysis framework public repo (so that adapting the script to include more ocn/ice diags will be easier)
