

CLASP Climate Process Team

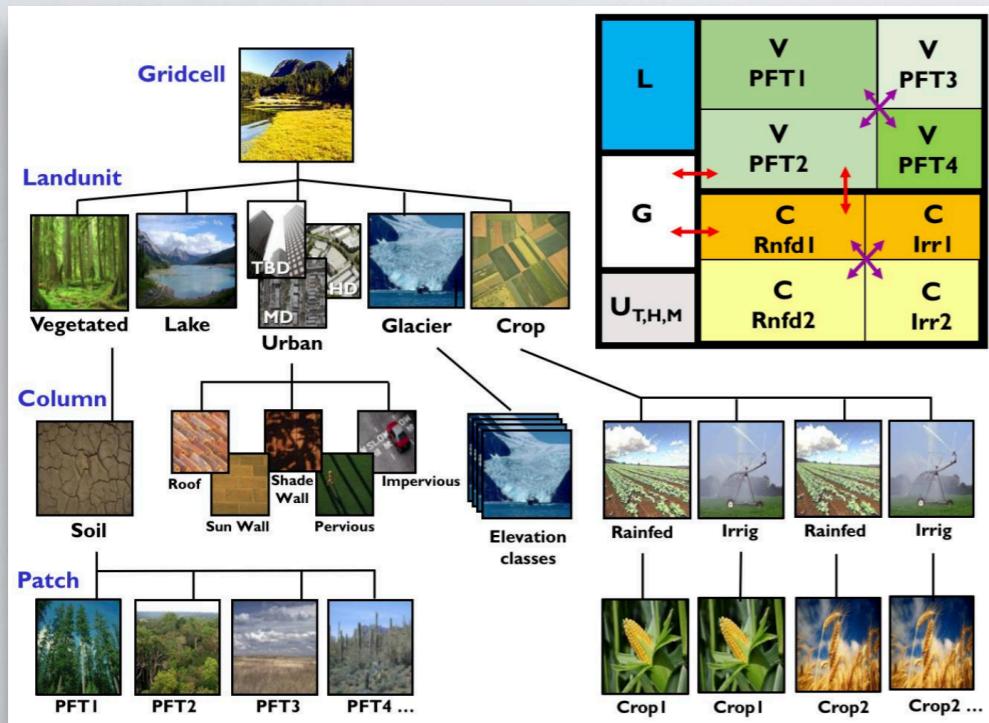

Coupling of Land and Atmospheric Subgrid Parameterizations

Nathaniel Chaney, Kirsten Findell, Po-Lun Ma, David Lawrence, Joseph Santanello,
Paul Dirmeyer, Forrest Hoffman, Elena Shevliakova, Michael Ek, Gabriel Katul, et al.

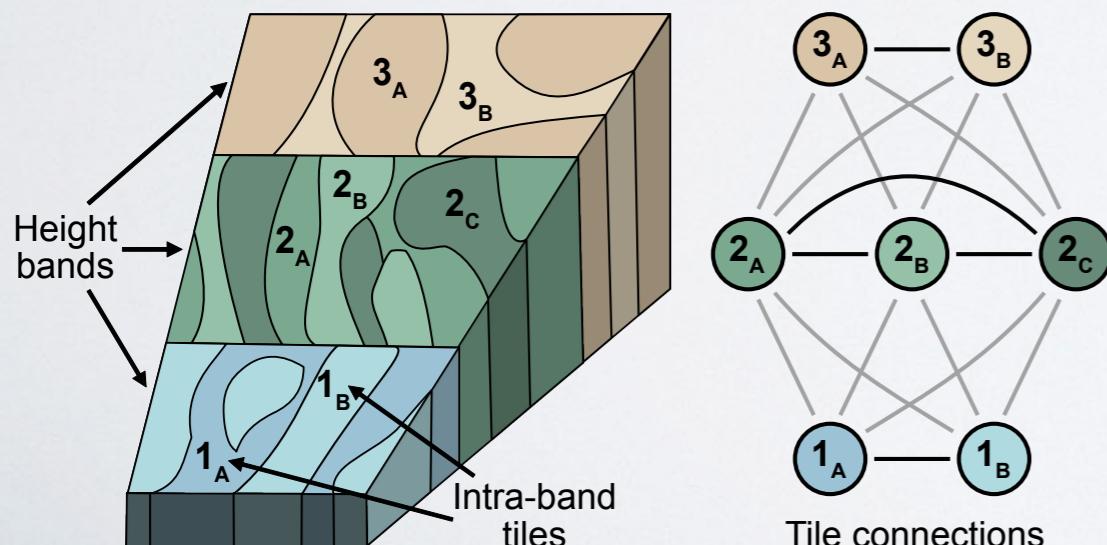

DOE RGMA PI meeting, October 13th, 2020

Sub-grid heterogeneity in the land component of Earth system models

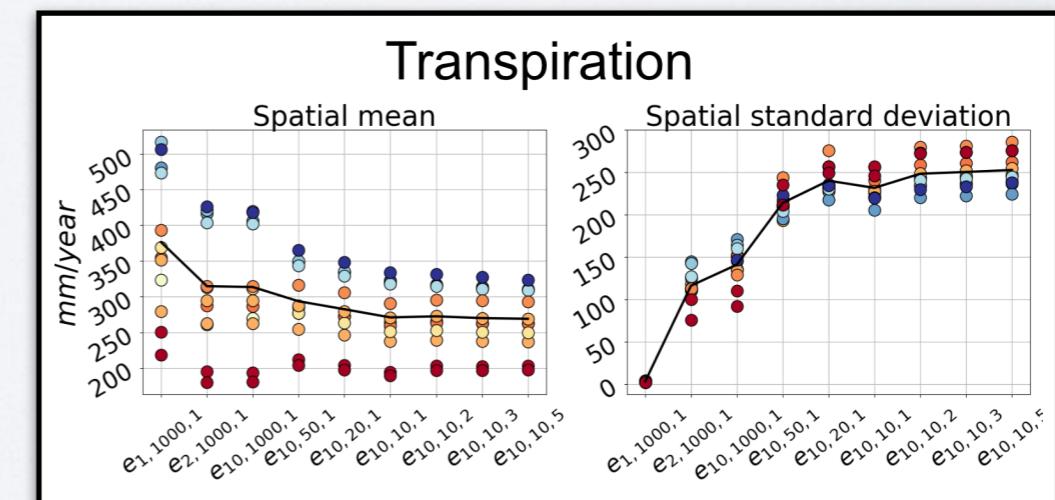

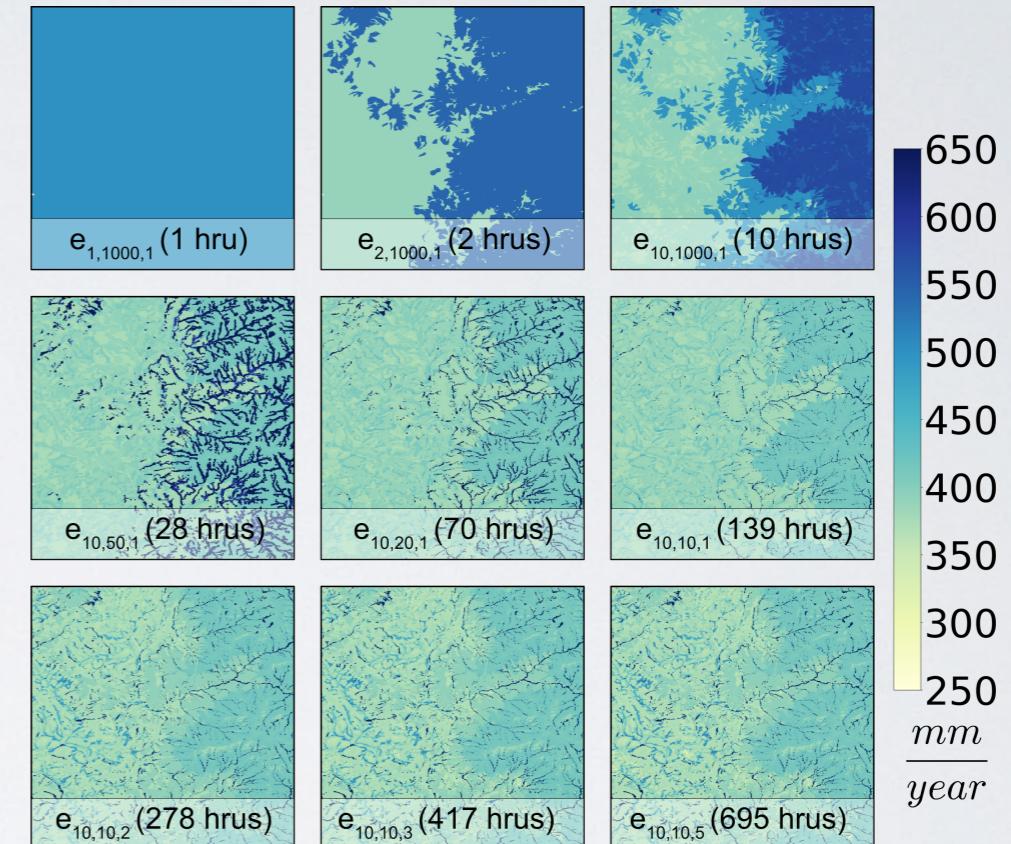

Lawrence et al., 2019

Characteristic hillslope

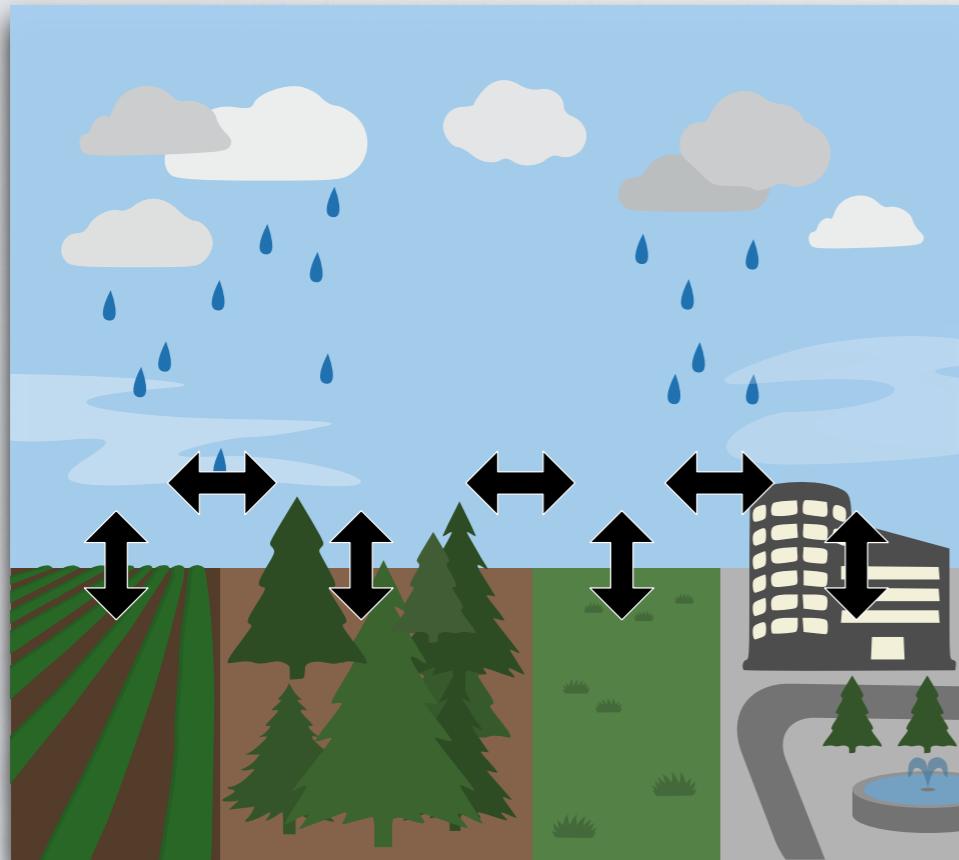

Subin et al., 2014

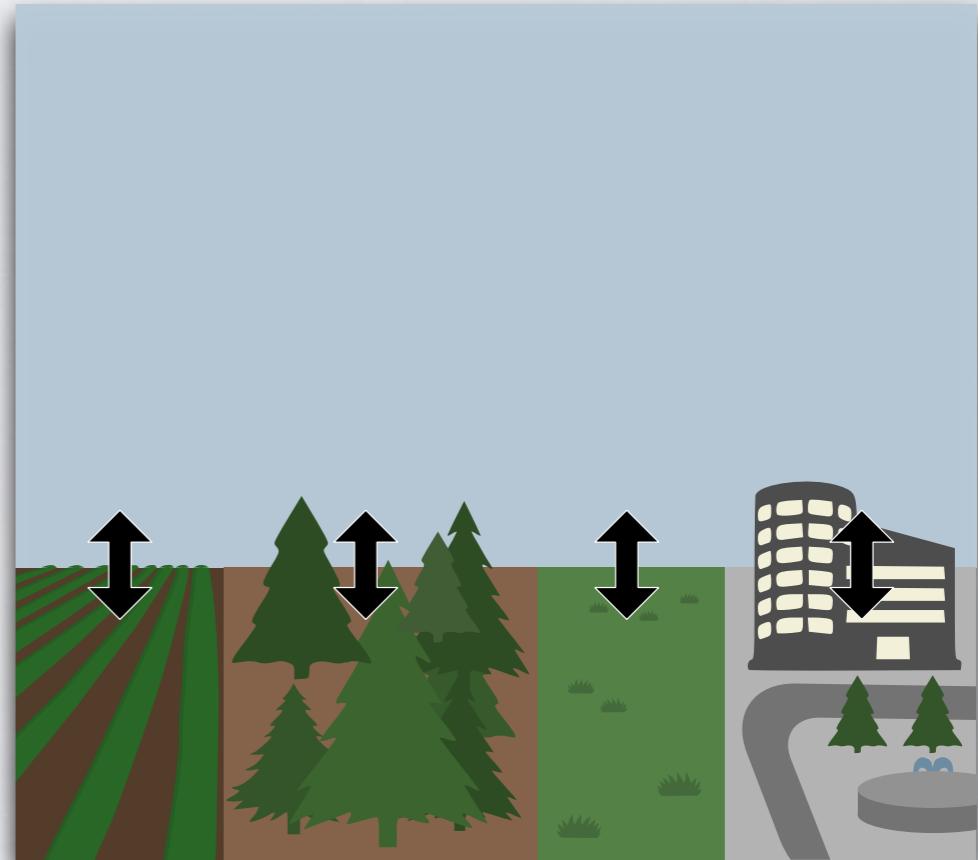

Mapped simulated transpiration annual mean (2002-2014)

The atmospheric column only effectively “feels” the sub-grid spatial mean

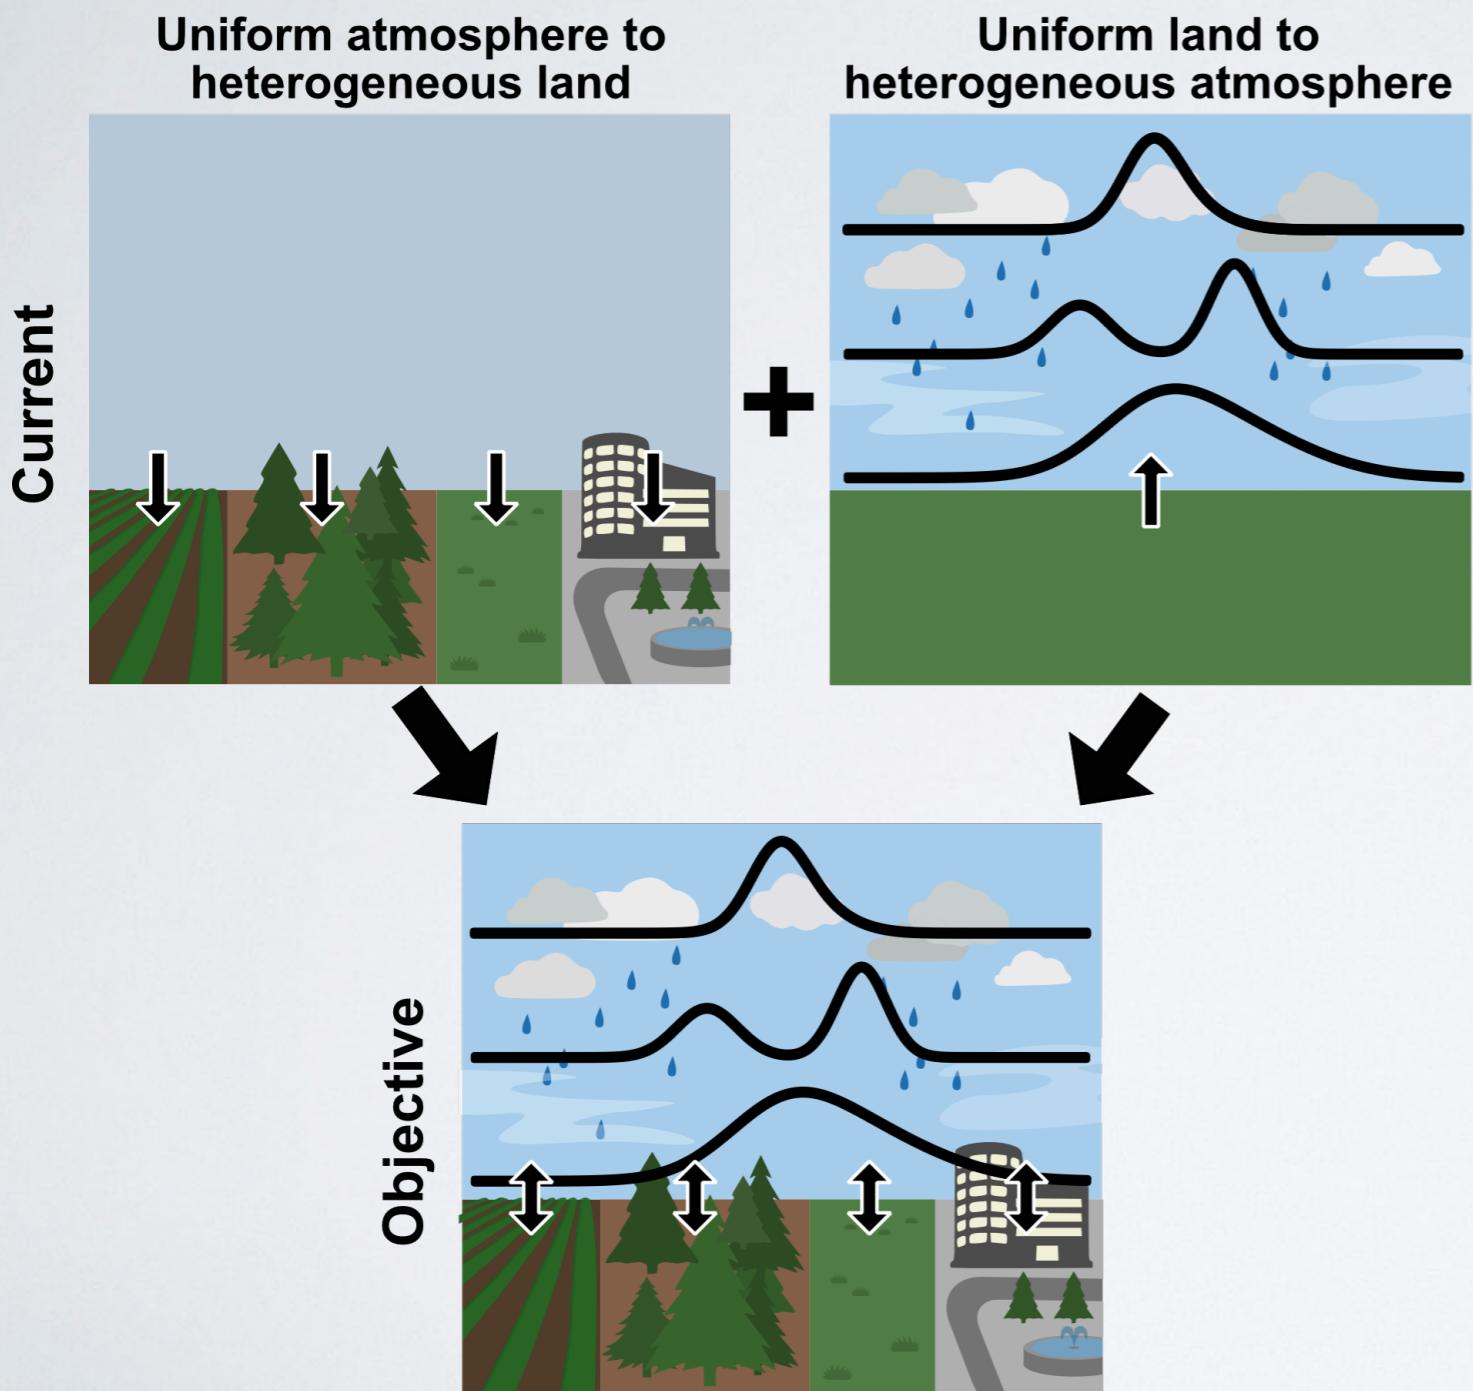

Coupled model: Wishlist

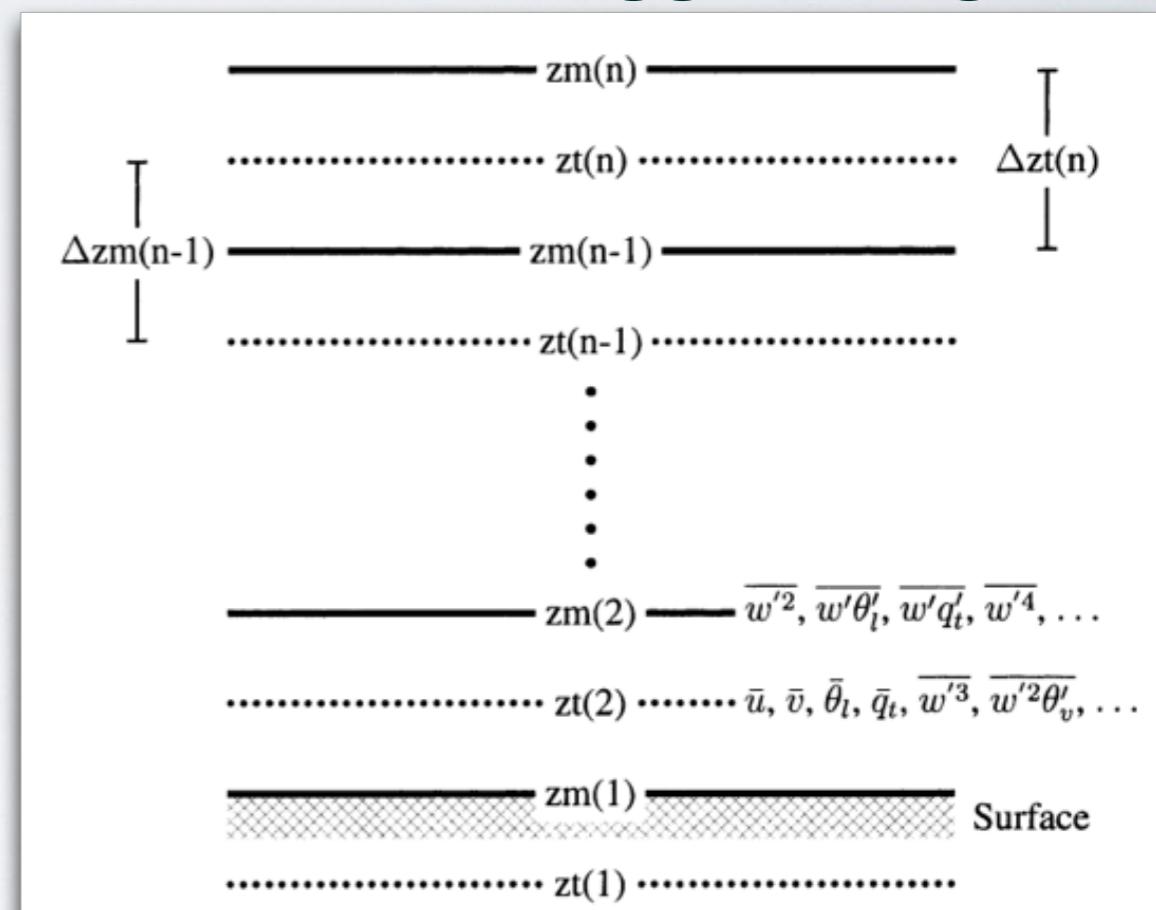

Coupled model: Reality

Problem: Currently, atmospheric models ignore all but the sub-grid spatial mean over land (e.g., latent heat flux)

How do we enable interaction between the “tiling” sub-grid approach over land and existing atmospheric sub-grid schemes (e.g., CLUBB - Cloud Layers Unified By Binormals)?

CLUBB's staggered grid

How do we use the modeled land surface heterogeneity to inform CLUBB's surface boundary conditions?

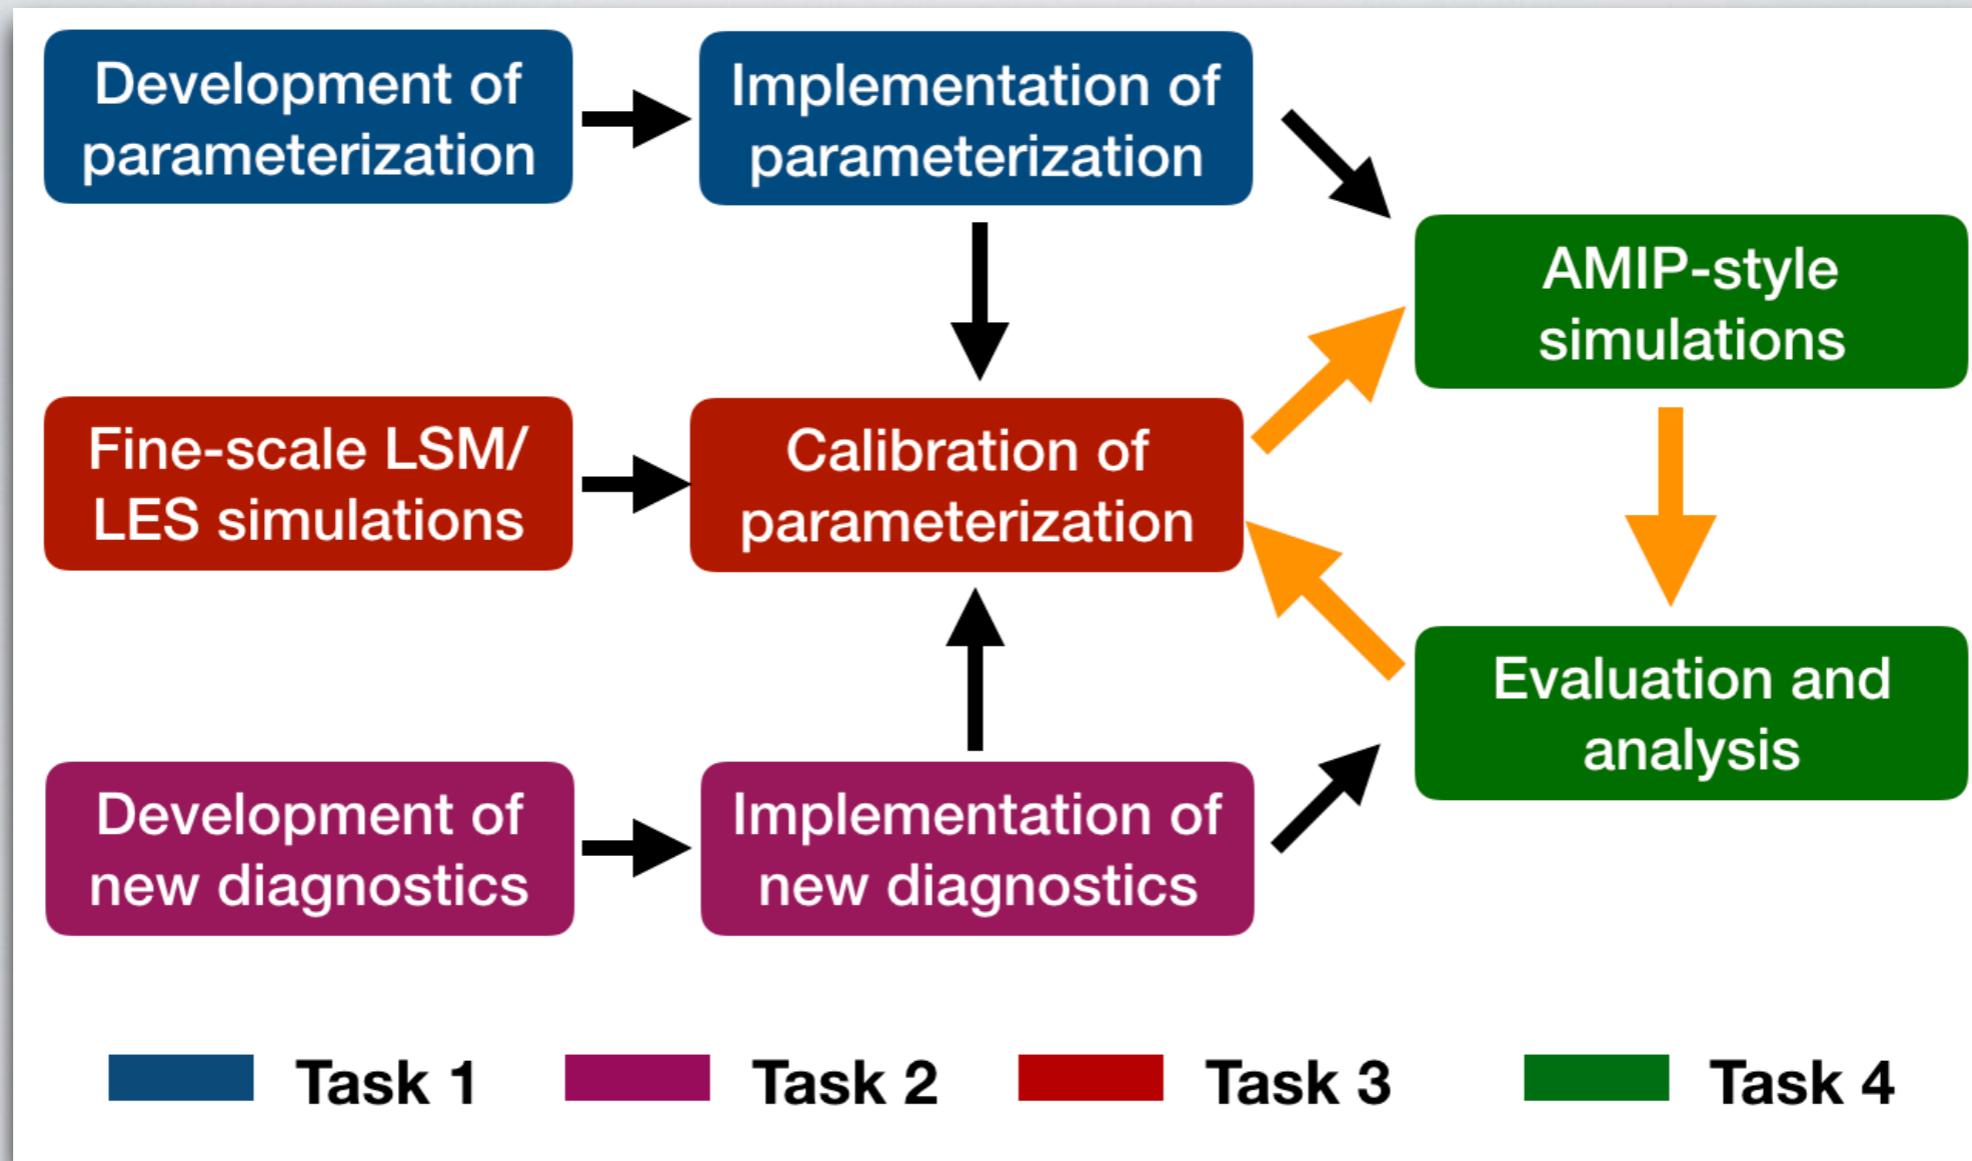

CLASP Climate Process Team

Coupling of Land and Atmospheric Subgrid Parameterizations

Objective: Parameterize heterogeneous exchanges between the land and atmosphere and to characterize its implications for surface climate, variability, and extremes.

CLASP tasks

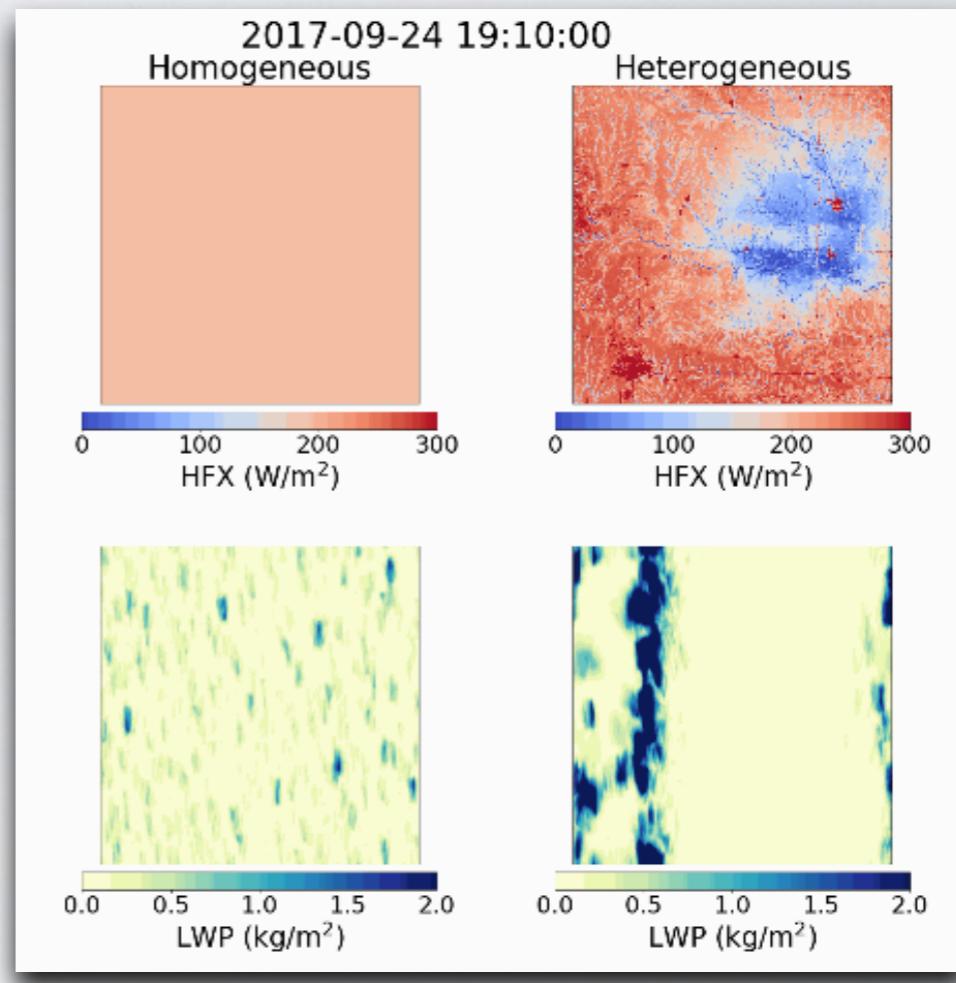

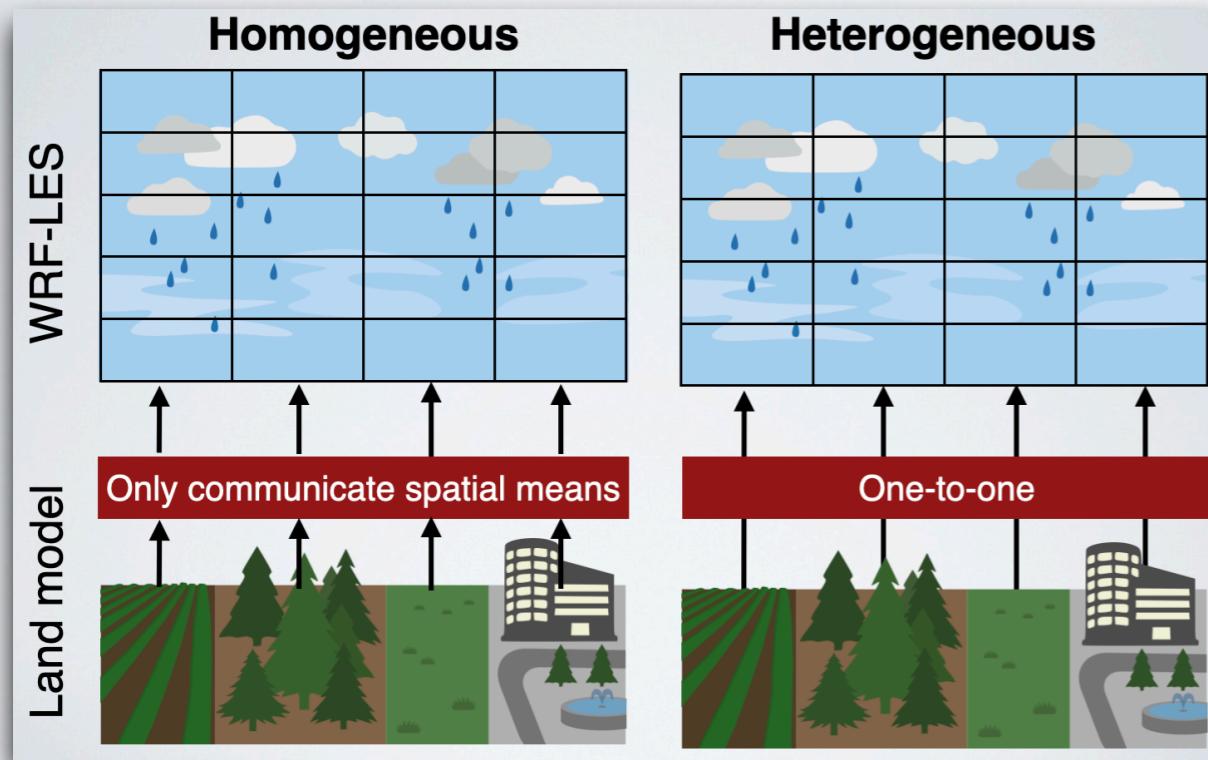

Participating
centers/models

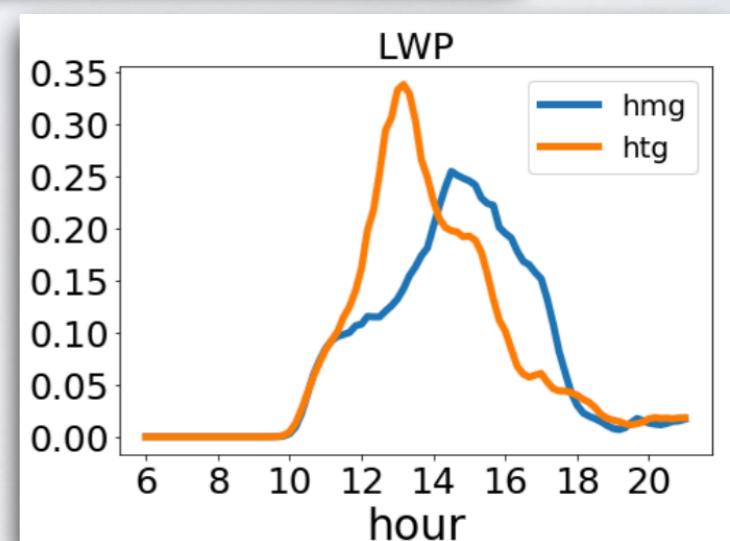

- DOE - E3SM
- NCAR - CESM2
- NOAA - CM4
- NASA - GEOS

CLASP-LES highlight

Use LES coupled to a land model to determine when/how sub-grid heterogeneity matters in the atmospheric response

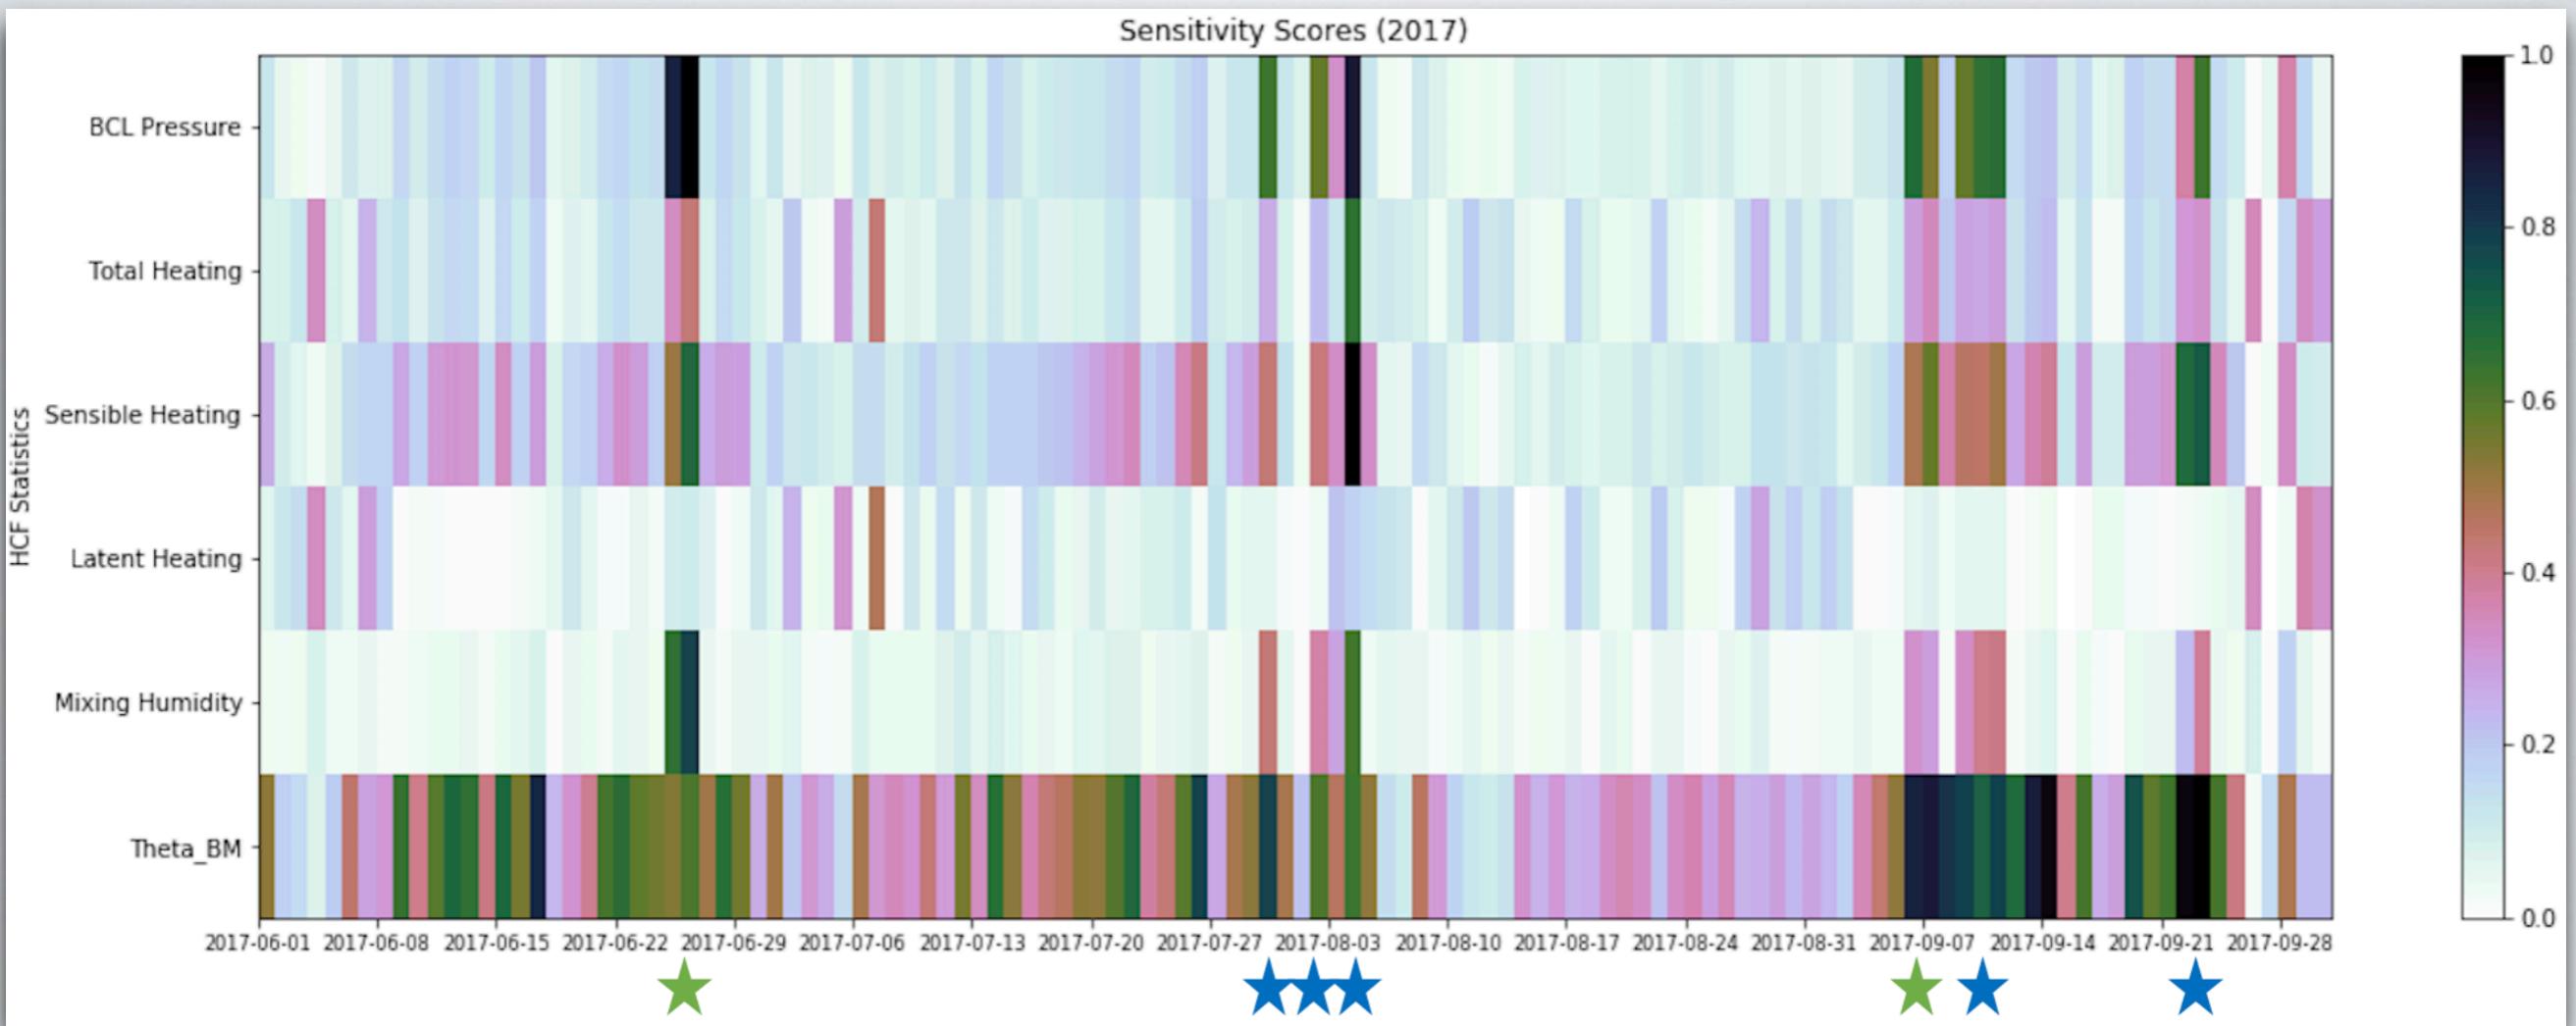

Large Eddy Simulations (LES) coupled to a high resolution land model with homogeneous vs. heterogeneous surface boundary over the ARM Southern Great Plains (SGP) site leveraging the data and model from the DOE LASSO project

- Chaney, N., et al. (2020), *Two-way coupling between the sub-grid land surface and river networks in Earth system models*, Geophysical Model Development, In review.
- Simon, J., et al. (2020), *Semi-coupling of a field-scale resolving land surface model and WRF-LES to investigate the influence of land surface heterogeneity in cloud development*, JAMES, In preparation.

CLASP-Diagnostics highlight

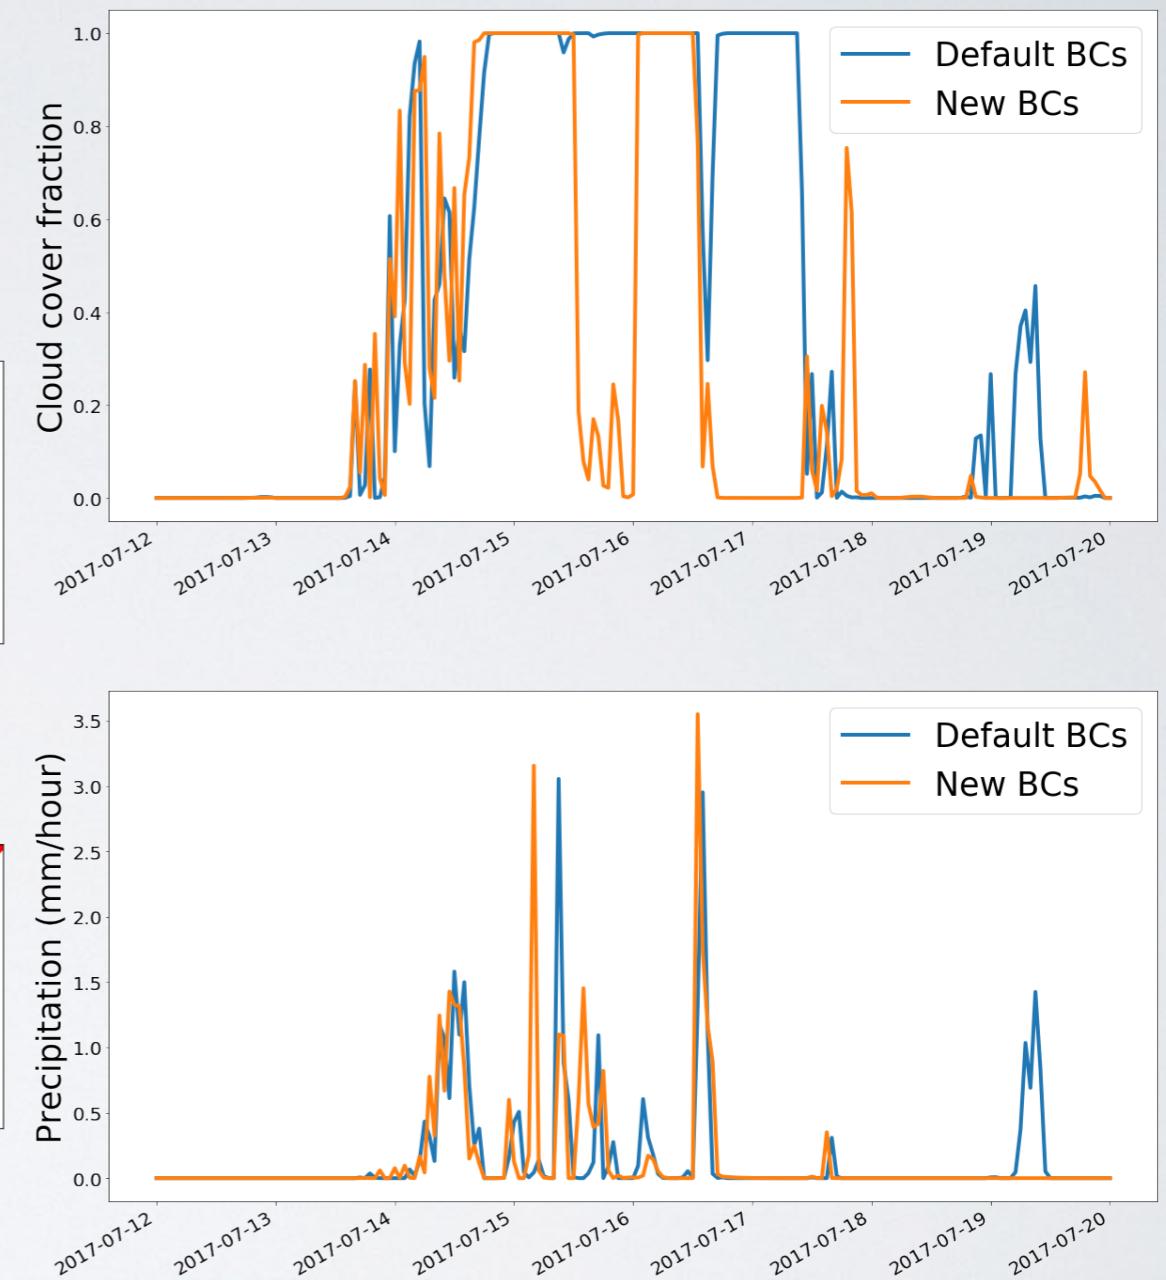

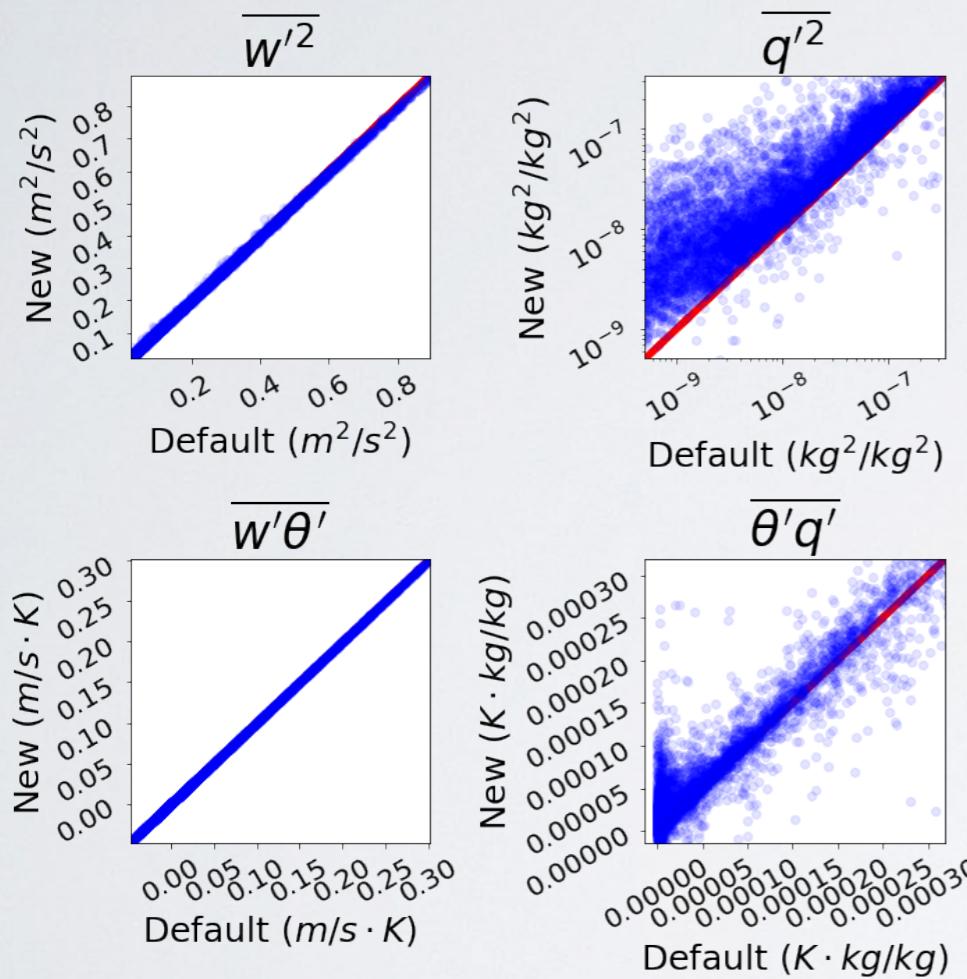

Create new diagnostics to determine when sub-grid heterogeneity plays a role in the macroscale response. Collaborating with CLASP-LES to tune the metric.

- Hay-Chapman, F. et al. (2021), *Diagnosing Sensitive Land-Atmosphere Coupling Days and Investigating the Impact of Land Surface Heterogeneity on the Overlying Atmosphere*, 2021 AMS annual meeting.

CLASP-Parameterization highlight

Leverage LES experiments and NEON eddy covariance data to parameterize the role of sub-grid land heterogeneity in CLUBB surface boundary conditions

- Waterman, T. et al. (2020), *Parameterizing Variance of Temperature Fluctuations Over Heterogeneous Landcover for Surface Boundary Conditions in Atmospheric Models*, *Boundary Layer Meteorology*, In preparation.
- Cai, J., et al. (2020), *Using Landsat-8 and ECOSTRESS land surface temperature to parameterize sub-grid tiling schemes and enable tile-level calibration of land surface models*, AGU Fall meeting.
